

Double channel high-side driver with analog current sense for automotive applications

Datasheet — production data

Features

Max transient supply voltage	V_{CC}	41V
Operating voltage range	V_{CC}	4.5 to 28V
Max on-state resistance (per ch.)	R_{ON}	12 m Ω
Current limitation (typ)	I_{LIMH}	74 A
Off-state supply current	I_S	2 $\mu A^{(1)}$

1. Typical value with all loads connected

■ General:

- Inrush current active management by power limitation
- Very low standby current
- 3.0V CMOS compatible input
- Optimized electromagnetic emission
- Very low electromagnetic susceptibility
- In compliance with the 2002/95/EC european directive
- Proportional load current sense
- High current sense precision for wide range current
- Very low current sense leakage

■ Diagnostic functions:

- Off-state open-load detection
- Current sense disable
- Thermal shutdown indication
- Output short to V_{CC} detection
- Overload and short to ground (power limitation) indication

■ Protection:

- Undervoltage shutdown
- Overvoltage clamp
- Load current limitation
- Self limiting of fast thermal transients
- Protection against loss of ground and loss of V_{CC}
- Thermal shutdown

- Reverse battery protection with self switch of the Power MOS
- Electrostatic discharge protection

Applications

- All types of resistive, inductive and capacitive loads
- Suitable as LED driver

Description

The VND5E012AY-E is a device made using STMicroelectronics® VIPower® M0-5 technology. It is intended for driving resistive or inductive loads with one side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table).

This device integrates an analog current sense which delivers a current proportional to the load current when CS_DIS high leads the current sense pin in high impedance.

Fault conditions such as overload, overtemperature or openload are reported via the current sense pin

Output current limitation protects the device in overload condition. In case of long overload duration, the device limits the dissipated power to safe level up to thermal shutdown intervention. Thermal shutdown with automatic restart allows the device to recover normal operation as soon as fault condition disappears.

Figure 3. Current and voltage conventions

2.1 Absolute maximum ratings

Applying stress which exceeds the ratings listed in the [Table 3](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	28	V
V_{CCPK}	Transient supply voltage ($T < 400$ ms, $R_{LOAD} > 0.5 \Omega$)	41	V
$-V_{CC}$	Reverse DC supply voltage	16	V
V_{CC_LSC}	Maximum supply voltage for full protection to short-circuit (acc. AEC-Q100-012)	18	V
$-I_{GND}$	DC reverse ground pin current	200	mA
I_{OUT}	DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	50	A
I_{IN}	DC input current	-1 to 10	mA
I_{CSD}	DC current sense disable input current	-1 to 10	mA
$-I_{CSENSE}$	DC Reverse CS pin current	200	mA
V_{CSENSE}	Current sense maximum voltage	$V_{CC}-41$ $+V_{CC}$	V V

Table 3. Absolute maximum ratings (continued)

Symbol	Parameter	Value	Unit
E_{MAX}	Maximum switching energy (single pulse) ($L = 0.47\text{ mH}$; $R_L = 0\ \Omega$; $V_{bat} = 13.5\text{ V}$; $T_{jstart} = 150\text{ }^{\circ}\text{C}$; $I_{OUT} = I_{limL}(Typ.)$)	110	mJ
V_{ESD}	Electrostatic Discharge (Human Body Model: $R=1.5K\Omega$; $C=100pF$) – V_{CC} , OUTPUT – INPUT, CS_DIS – CURRENT SENSE	5000 4000 2000	V
V_{ESD}	Charge device model (CDM-AEC-Q100-011)	750	V
T_j	Junction operating temperature	-40 to 150	$^{\circ}\text{C}$
T_{stg}	Storage temperature	-55 to 150	$^{\circ}\text{C}$

2.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	Maximum value	Unit
$R_{thj-case}$	Thermal resistance junction-case (With one channel ON)	2	$^{\circ}\text{C/W}$
$R_{thj-amb}$	Thermal resistance junction-ambient	See Figure 36 in the thermal section	$^{\circ}\text{C/W}$

2.3 Electrical characteristics

$8V < V_{CC} < 28V$; $-40^{\circ}C < T_j < 150^{\circ}C$, unless otherwise specified

3 Application information

Figure 32. Application schematic

Note: Channel 2 has the same internal circuit as channel 1.

3.1 Load dump protection

D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the V_{CCPK} max rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

3.2 MCU I/Os protection

When negative transients are present on the V_{CC} line, the control pins is pulled negative to approximately -1.5 V. ST suggests to insert a resistor (R_{prot}) in line to prevent the microcontroller I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation 1

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH})/I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -1.5$ V; $I_{latchup} \geq 20$ mA; $V_{OH\mu C} \geq 4.5$ V

$$75 \Omega \leq R_{prot} \leq 240 \text{ k}\Omega$$

Recommended values: $R_{\text{prot}} = 10 \text{ k}\Omega$, $C_{\text{EXT}} = 10 \text{ nF}$.

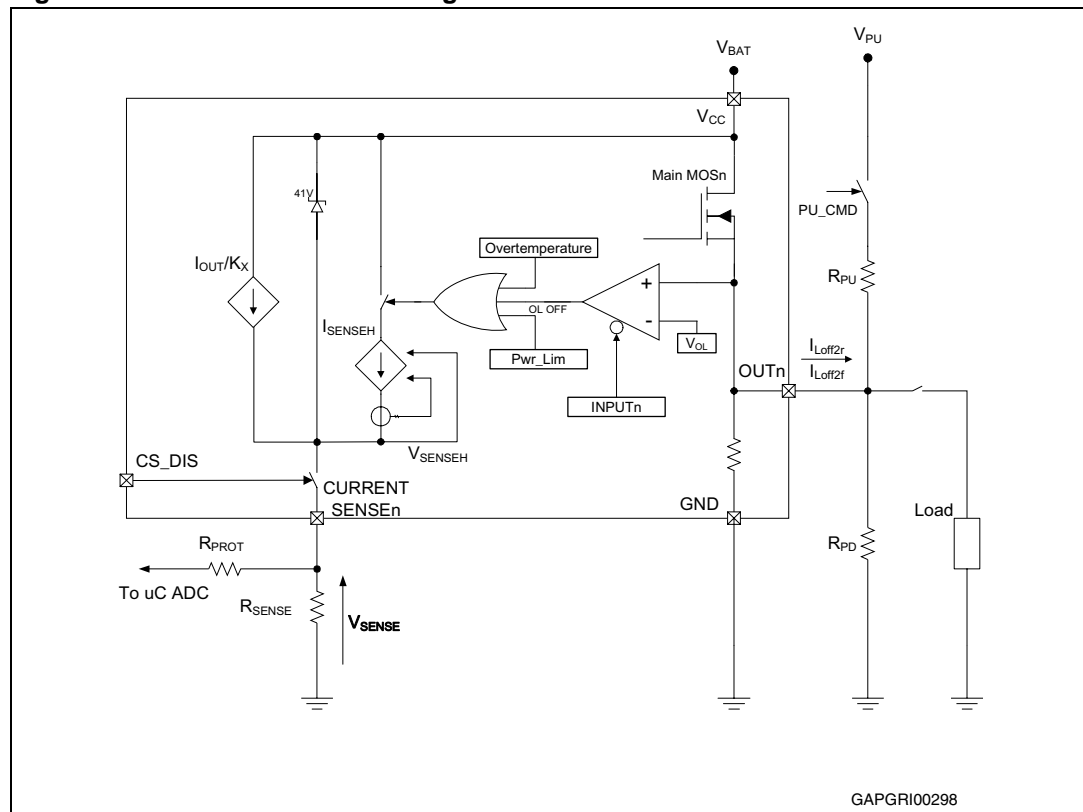

3.3 Current sense and diagnostic

The current sense pin performs a double function (see [Figure 33: Current sense and diagnostic](#)):

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load one according to a known ratio K_x .
The current I_{SENSE} can be easily converted to a voltage V_{SENSE} by means of an external resistor R_{SENSE} . Linearity between I_{OUT} and V_{SENSE} is ensured up to 5 V minimum (see parameter V_{SENSE} in [Table 7: Current sense \(\$8V < V_{\text{CC}} < 18V\$ \)](#)). The current sense accuracy depends on the output current (refer to current sense electrical characteristics [Table 7: Current sense \(\$8V < V_{\text{CC}} < 18V\$ \)](#)).
- **Diagnostic flag in fault conditions**, delivering a fixed voltage V_{SENSEH} up to a maximum current I_{SENSEH} in case of the following fault conditions (refer to [Table 11: Truth table](#)):
 - Power limitation activation
 - Overtemperature
 - Short to V_{CC} in off-state
 - Open load in off-state with additional external components.

A logic level high on CS_DIS pin sets at the same time all the current sense pins of the device in a high-impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing of sense resistance and ADC line among different devices.

Figure 33. Current sense and diagnostic

3.3.1 Short to V_{CC} and off-state open-load detection

Short to V_{CC}

A short-circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device OFF-state. Small or no current is delivered by the current sense during the ON-state depending on the nature of the short-circuit.

Off-state open-load with external circuitry

Detection of an open load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable V_{PU} to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

An external pull-down resistor R_{PD} connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see [Figure 33: Current sense and diagnostic](#)).

R_{PD} must be selected in order to ensure V_{OUT} < V_{OLmin} unless pulled-up by the external circuitry:

Equation 2

$$V_{out}|_{Pull-up_off} = R_{PD} \cdot I_{L(off2)f} < V_{OLmin} = 2V$$

$R_{PD} \leq 22 \text{ k}\Omega$ is recommended.

For proper open load detection in off-state, the external pull-up resistor must be selected according to the following formula:

Equation 3

$$V_{OUT}|_{Pull-up_ON} = \frac{(R_{PD} \cdot V_{PU}) - (R_{PU} \cdot R_{PD} \cdot I_{L(off2)r})}{(R_{PU} + R_{PD})} > V_{OLmax} = 4V$$

For the values of V_{OLmin} , V_{OLmax} , $I_{L(off2)r}$ and $I_{L(off2)f}$ (see [Table 8: Open-load detection \(8V < V_{CC} < 18V\)](#)).

3.4 Maximum demagnetization energy ($V_{CC} = 13.5\text{ V}$)

Figure 34. Maximum turn-off current versus inductance⁽¹⁾

1. Values are generated with $R_L = 0\ \Omega$.

In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

4 Package and PCB thermal data

4.1 PowerSSO-36 thermal data

Figure 35. PowerSSO-36 PC board

Note: Layout condition of R_{th} and Z_{th} measurements (PCB: Double layer, Thermal Vias, FR4 area= 129mm x 60mm, PCB thickness=1.6mm, Cu thickness=70 μ m (front and back side), Copper areas: from minimum pad lay-out to 8cm²).

Figure 36. $R_{thj-amb}$ vs PCB copper area in open box free air condition (one channel ON)

Figure 37. PowerSSO-36 Thermal impedance junction ambient single pulse (one channel ON)

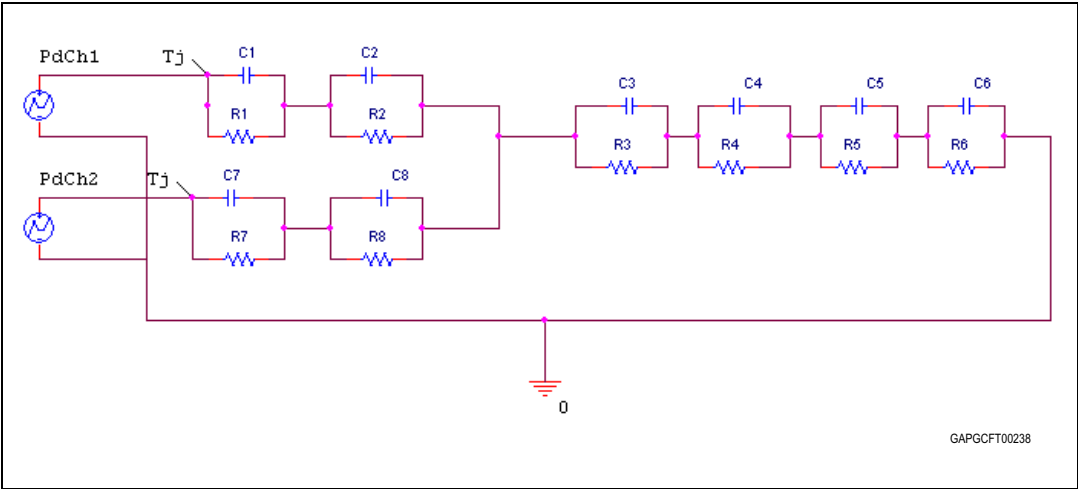

Figure 38. Thermal fitting model of a double channel HSD in PowerSSO-36⁽¹⁾

1. The fitting model is a simplified thermal tool and is valid for transient evolutions where the embedded protections (power limitation or thermal cycling during thermal shutdown) are not triggered

Equation 4: pulse calculation formula

$$Z_{TH\delta} = R_{TH} \cdot \delta + Z_{THtp}(1 - \delta)$$

where:

Equation 5

$$\delta = t_p / T$$

5 Package information

5.1 ECOPACK[®] package

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.
